No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DB seq

APPLICANT: PHILLIPPE, Michel
APPLICANT: GARSON, Jean-Claude
PITLE OF INVENTION: Jean-Pierre
TITLE OF INVENTION: COSMETIC OR DERMATOLOGICAL COMPOSITION CONTACTING AT
FILE REFERENCE: 6388-0365-0
CURRENT APPLICATION NUMBER: US/09/247,806
CURRENT APPLICATION NUMBER: EF 98/01614
EARLIER APPLICATION NUMBER: EF 98/01614
SOFTWARE: PATE: 1998-02-11
EARLIER FILING DATE: 1998-02-11
SOFTWARE: Patentin Ver. 2.1
LENGTH: 651
TYPE: PRT
OPGRANTCM. NACH: 12 01-11-11
                                                                                                               COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
                                                                                                                                                                                                                                                                                                    APPLICANT: Lewis, Randolph V.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DB DB

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a OspA in the form of a vaccine. The method is used for protecting animals, P. salmonis. The method is used for protecting animals, P. salmonis. The method is also useful for protecting against salmonid sequence represents P. salmonid (SRS) and other rickettsial diseases. The present N-terminal fusion partner is used in a vaccine to create an anti-OspA antihody response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animal particularly polkilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The press sequence represents optimised P. salmonis OspA protein 17E2. The DNA encoding OspA 17E2 (AAR86247) has been optimised for expression in Ecsherichia coll. An OspA protein with an N-terminal fusion partner is used in a vaccine to create an anti-OspA antibody response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed Ospa, or an immunogenic fragment of

This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly poikilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence of C17E2, a P. salmonis OspA construct optimised for expression in Escherichia coli, fused to an undefined N-terminal fusion partner. The fusion protein is used in a vaccine to create an anti-OspA antibody response.

2001-316844/34.

This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a OspA in the form of a vaccine. The method is used for protecting animals particularly polkilothermic fish, against the bacterial pathogen animals. The method is also useful for protecting animals, rickettsial septicaemia (SRS) and other ricketting against pathogen represents an immunogenic epitope of the P. salmonis. The peptide is used to raise rabbit anti-OspA antibodies.

Method for protecting polkilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis

The present sequence is that of BASB113 protein from Moraxella catarrhalis strain Mc2931 (ATCC 43617), a causative agent of otitis media in children and pneumonia in adults. The invention provides BASB113 polypeptides, and polypucleotides encoding them, as well as expression vectors, host cells and methods for producing BASB113 polypeptides using recombinant methods. Also claimed is a vaccine composition comprising a BASB113 polypeptide, an immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DЪ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against porphorymonas gingivalis. Probes can be used to detect porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease
AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAX94583. AAX91802 to AAX91899 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can

                The PBOMP proteins were isolated from a PBOMP-enriched insoluble cell wall fraction from physically disrupted cells of H. influenzae and then solubilising the PBOMP from the cell wall fraction by heating in the presence of a detergent or digesting the cell wall fraction with lysozyme, opt. in the presence of a detergent. The genes encoding the PBOMP proteins were isolated by screening a DNA library with an oligonucleotide probe based on the amino acid sequence of the PBOMP protein, or using antibodies to PBOMP.

The invention relates to isolated polynucleotide (I) and CC polymerase (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful in gene therapy techniques (CC quantitating a polypeptide in tissue, as molecular weight in medical cCC quantitating a polypeptide in tissue, as molecular weight in medical a food supplement (II) and its binding partners are useful in medical cCC disorders involving aberrant protein expression or biological activity. CCC diagnostics, forensics, gene mapping, identification of mutations in CCC and to produce other types of data and products dependent on DNA and CCC and to produce other types of data and products dependent on DNA and CCC specification, but was obtained in electronic format directly from WIPO CCC at fire winds of this patent did not appear in the printed cat fits winds other than and sequences of the invention.

                                          The present sequence is that of the orb-weaver spider (Nephila CC clavipes) recombinant silk protein pETNoDS. The invention CC provides methods for purifying and spinning spider silks and other CC structural proteins. Organic acids are used to lyse recombinant CC delived cells), and enrich the purity and yields of structural proteins samples (such as non-recombinantly CC proteins by hydrolysing many of the macromolecules while leaving CC resulting lysate is further purified by in-exchange or affinity CC chromatography and processed into an aqueous-based mixture for CC into vector pET24 for recombinant expression in Escherichia coli, CC containing denaturant (3 M guanidine-HC1) and by affinity CC chromatography on nickel-WTA agarose. Products obtained using the materials including films, fibres, woven articles, sutures.
materials including films, fibres, woven articles, su ballistic protection, parachutes and parachute cords. method has the following advantages over prior art: i fewer steps, requires less time and smaller volumes o

                                                                                                                                                                       capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), approach the sequences (ABL16176-ABL30511).
                                                                                                  Sequence
                                                                                                                        The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent
                                                                                                                                                                                                                                                                           Disclosure; SEQ ID NO 25488;
                                                                                                                                                                                                                                                                                                      New isolated nucleic acid genes from Drosophila and interactions -
                                                                                                                                                                                                                                                                                                                                                      WPI; 2001-656860/75

                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2179
                                                                                                                                                                                       (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from
                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            23-MAR-2000; 2000US-191637P

The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions are used use as hair or skin care products; and make up or sunscreens. As the protein is a good, persistent film-formers on the skin agents that are generally difficult to administer, e.g. vitamins, noisturizers or agents for treating disorders of the

                                                                                                                                               The spider silk protein contains a basic 34 amino acid repeat. The repeat itself contains 3 regions. The first comprises 0-9 amino acids with a sequence AgR(GGX)2. This region is not highly conserved. The second region has a sequence GAG(A)x which is highly and is 18-10 amino acids long. The third segment is (GGX)2 and is 15 amino acids long and is very highly conserved. In most cases X is A,Q, Y or L. Removal of the poly-(Ala) segments results
                                                                                                                                  Sequence
